

Student Evaluation Response Paper

Question 1 Response

Question 1: Explain the primary difference between a list and a tuple in Python.

Student Answer: Lists can be modified after you make them, so they are mutable. Tuples are completely fixed and immutable, meaning you cannot append or change elements inside them. Lists use brackets and tuples use round brackets.

Question 2 Response

Question 2: What is the purpose of the 'init' method in a Python class?

Student Answer: The init function is used to create a class. It sets up the variables and attributes for the object whenever you create a new instance of that class in your code.

Question 3 Response

Question 3: Define the concept of Overfitting in Machine Learning.

Student Answer: Overfitting is when a model performs incredibly well on the training data but fails to predict anything accurately when you give it new test data. It basically memorizes the dataset instead of finding the actual trend.

Question 4 Response

Question 4: What does the acronym SQL stand for and what is its primary use?

Student Answer: SQL stands for Sequential Query Language. It is used to

build websites, manage web servers, and design user interfaces for online applications.
